Anote—"Vector: pBACWICH; Site\_1: HindIII; Site\_2: HindIII; Rice blast is one of the most devestating fungal diseases of rice world wide. It is a filamentous ascomycete with a haploid genome (n=7) of approximately 40 Mbp. Rice blast is an important model fungal pathogen for studying numerous aspects of the fungal host interaction. In order to facilitate genome wide analysis, a BAC library kb was constructed. This library represents size of 130 kbm was constructed. 5, than 25% genome coverage. High density colony filters are available upon request." 1 others 995 tcactctccagttcaagaccacacttctactaaccacactttggactctaacccagctac 1054 1055 tttcccattgaacgctactttgtacgctgacttctctcacgacaacactatggtttctat 1114 755 aggigitaacitgactgacgaagacgitgitaacitgaiggacaigigicalicgacac 814 614 AGGGTGAAACCTCACGGCCAAGCAAGCGGTGCAGATCATGAGCTTCTGCCGGTTTGAGAC 555 1115 tttcttcgctttgggtttgtacaacggtactaagccaitgtctactacttctgttgaatc 1174 1175 ta-----ttgaagaaactgacggttacgctgcttcttggactgttccattcgctgctag 1228 875 cgaatggattcaatacgactacttgcaatctttgggtaagtactacggttacggtgctgg 934 10.6%; Score 151; DB 227; Length 802; 55.2%; Pred. It is a filamentous ascomycete with blast is an important model approximately 40 Mbp. Rice hast is an important model fungal pathogen for studying numerous aspects of the fungal-host interaction. In corder to facilitate genome wide analysis, a BAC library kbp was constructed. This library represents greater than 25% genome coverage. High density colony filters
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Eukaryota; Fungi; Ascomycota; Pezizomycotina; Sordariomycetes; Sordariomycetes incertae sedis; Magnaporthaceae; Magnaporthe. 1 (bases 1 to 753)

Rice blast is one of the most devestating fungal diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AQ361474 769 bp DNA GSS 03-FEB-1999 mgxb00004112f CUGI Rice Blast BAC Library Magnaporthe grisea genomic
a haploid genome (n-7) of approximately 40 Mbp. Rice blast is an important model fungal pathogen for studying numerous aspects of the fungal host interaction. In order to facilitate genome wide analysis, a BAC library containing 9216 clones with an average insert size of 130 kbp was constructed. This library represents greater than 25x genome coverage. High density colony filters are available upon request. "

                                 of files would when the state of approximately 40 Mbp. Rice a haploid genome (n=7) of approximately 40 Mbp. Rice blast is an important model fungal pathogen for studying blast is an important model fungal-host interaction. In order to facilitate genome wide analysis, a BAC library containing 9216 clones with an average insert size of 130 kbp was constructed. This library represents greater than 25% genome coverage. High density colony filters har available upon request.

Anotes "Vector: Data With Site_1: HindIII; Site_2: HindIII; Rice blast is one of the most devestating fungal diseases of rice world wide. It is a filamentous ascomycete with a haploid genome (n=7) of approximately 40 Mbp. Rice blast is an important model fungal pathogen for studying numerous aspects of the fungal host interaction. In order to facilitate genome wide analysis, a BAC library containing 9216 clones with an average insert size of 130 kbp was constructed. This library represents greater than 25X genome coverage. High density colony filters are available upon request."

order to facilitate genome wide analysis, a BAC library containing 9216 clones with an average insert size of 130 kbp was constructed. This library represents greater area available upon request. " 1 others
                                                                                                                                                                                                                                                                                                                                                                 /note="Vector: pBACWICH; Site_1: HindIII; Site_2: HindIII; Rice blast is one of the most devestating fungal diseases of rice world wide. It is a filamentous ascomycete with a haploid genome (n=7) of approximately 40 Mbp. Rice blast is an important model fungal pathogen for studying numerous aspects of the fungal-host interaction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 gctagattgactcactctccagttcaagaccacacttctactaaccacactttggactct 1043

This sequence is a single read and was generated as part of a large
scale clone-end sequencing project of the Tetraodon nigroviridis
genome. For more information, please take a look at

3-phytase (EC 3.1.3.8) A precursor - Aspergillus awamori
N.Alternate names: myo-inositol hexakisphosphate phosphohydrolase; phyA protein
C;Species: Aspergillus awamori
C;Date: 14-0ul-1994 #sequence\_revision 19-oct-1995 #text\_change 11-Jun-1999
C;Accession: JNO889
R;Piddington, C.S.; Houston, C.S.; Paloheimo, M.; Cantrell, M.; Miettinen-Oinonen, A. Gene 133, 55-62, 1993
A;Title: The cloning and sequencing of the genes encoding phytase (phy) and pH 2.5-op

A; Accession: JN0889

A; Molecule type: DNA
A; Residues: 1-467 <PIDA
A; Cross-references: 68:102421; NID:9166518; PIDN:AAA16898.1; PID:9166519
A; Bayerimental source: strain ALK0243
A; Note: part of the sequence, including the amino end of the mature protein, was conf C; Genetics:
A; Gene: phyA
A; Introns: 15,2
C; Genetics: A; Gene: phyA
A; Introns: 15,2
C; Superfamily: yeast acid phosphatase
C; Keywords: extracellular protein; glycoprotein; phosphohistidine; phosphoprotein; ph
F; 1-19,7 Domain: signal sequence #status experimental AMAT>
